An Inquiry into the symptoms &c of Diabetes.

This is a disease in its commencement but seldom noticed by the patient labouring under it, and of course rarely falling under the observation of the medical practitioner until it has reached a more advanced stage.

The symptoms which point out its existence are a craving appetite, insatiable thirst, dry mouth, accompanied with a bitter or mousekish taste, ~~swelled~~ gums, teeth as if on edge from acids, loose in their sockets, whitish tongue with red edges, increased quantities of urine, which generally has a sweetish taste, and resembles in appearance a solution of honey in water, with a slight greenish tinge, extreme wasting of the flesh in a majority of cases, consterness but in some instances an obstinate laxity of the bowels; dry skin most frequently hot, occasionally having a cold clay-like feel, flushed of the face, head ach, an intermission of the general appetite, soreness and a slight degree of swelling about the glands, penis in males; an uneasiness at the termination of the urethra in females; a sensation of weight at the seat of the stomach, and a pain in the region of the kidneys. slight steterium, generally confined to the night.

The seat and proximate cause of this disease have been matter of anxious inquiry and diligent search among Physicians in every age of medical science, from the time of Hippocrates to the present day, to enumerate the various hypotheses which has been formed by the several authors who have written on the subject would form a catalogue affording neither instruction nor amusement equal in value

to the time which must necessarily be expended in its compilation.

The Author of this page, after examining the several opinions which have fallen within his reach, has been led inevitably to adopt the sentiments of Professor Rush: i.e., that diabetes has its origin in a disease ~~of~~² of the liver, with a view to the establishment of this doctrine the following sheets are devoted.

The late celebrated Doctor Cullen¹ considered this disease as arising from "some fault in the assimilatory powers or in those employed in converting alimentary matter into the proper animal fluids"²; among the abettors of this opinion we may also place Doctor Home³. This view of the subject however was only hinted at in a distant manner, until Doctor Rollos⁴ ushered it into the world, reduced to a more definite form, but the greater number of his reasons for believing diabetes a disease of the stomach will support, with more energy, the opinion of its being a disease of the liver. It has long been known, that in diseases of the liver alkaline substances were serviceable; we find jaundice frequently cured by soda, either alone or combined with soap; the several preparations of iron

have also been used for the same purpose. Opium when tho' ³
refuses of the liver &c languidly produce great benefit in
stimulating them to a more vigorous and healthy action.

Doctor Pollio acknowledges a deficiency of bile coincident
by light coloured stools & as noticed by Doctor Aspinwall ⁴.

Doct Bullen, altho' advocating a different opinion, states facts
going far to prove the doctrine here defended to be correct :
it frequently (says he) happens to men who for a long time before
had been intemperate in drinking, that it happens to persons
of a broken constitution or who are frequently excepted it are
in a cachetic state, that it follows intermittent fevers, &
intemperance in the use of spirituous liquors very generally pro-
duce diseased action in the liver that a great number of the
forms of disease included by Doct Bullen in his class lod-
gia arise from disease of the liver is a fact I believe not to
be denied and that a diseased liver succeeds intermitents more
frequently than any other form of disease (an enlargement
of the spleen perhaps excepted) is equally certain. Doct Davison
suspects some connection of such as he conceives the diseased
organ with the liver in Mr Brundley's case Doct Almadi ⁵
considers diabetes as liable to jaundice and affirms that ⁶

strataceous tumours are found in the liver as to the soundness of the tissue this is dubious & this opinion of Dr. Mead is taken notice of by Professor Rush. It is asserted that the liver is frequently found in a sound state contrary to the observation of Doctor Mead this has arisen no doubt in many instances from want of attention for we find in the cases of deposition reported by Dr. Duncan ^{son} and Doctor Rush that altho' the liver is stated to have been sound in the same report they inform us that the contents of the gall bladder differed from healthy bile. Professor Rush has moreover proven to us that the liver may be greatly diseased and still exhibit no morbid marks, under the knife.

Mr. William Scott, Surgeon in the service of the East India company, cured both the patients which came under his observation under diabetes with mercury after many other remedies had been tried in vain ^{one} of these relapsed who was afterwards restored to health by the use of the nitric Acid. The good effects of Nitric Acid in diseases of the liver are too well known to require any comment. — Doct. Hollingshead patient recovered by the use of a prescription of which mercury formed

form a part. — the number of instances stated by Dr. Robert
Watt in his cases & shew the insufficiency of Doct^r Rollos' plan
and at the same time almost demonstrate these principles to
be just by the signal success attending the free use of the lancet
under the most unpromising circumstances. Doctor Rush has
succeeded in four cases out of five by the last mentioned mode
of treatment. — the case related by Professor Bartow, in his lec-
tures, of a Gent^r one of the officers of the bank, having been con-
victed by confinement to vegetable diet, gives a death blow to the
theory of Doctor Rollos, and effects much in establishing the
Rushian doctrine.

Two instances of this disease have fallen under
my own observation these cases occurred several years ago, at
a time when Doct^r Rush's theory of this disease had not fallen
into my hands, they were treated agreeably to Doct^r Rollos' plan,
both of them were very greatly amended during the continuance
of the animal diet, &c. but the disease returned in a few months
after resuming their former mode of life a habit of which
consisted in the liberal intemperance of spirituous liquors. one of
these cases has terminated fatally, the subject of the other
wearing gradually out at the last information. I have no
hesitation in believing that both these men laboured under
disease of the liver, they had long been in the habit of bowering in
lowly devotion before the throne of Bacchus, and one of them
bore

The image shows a single page from an old manuscript. The page is filled with dense, handwritten text in a cursive Gothic script. The paper is a light beige or cream color, showing signs of age such as creases, faint smudges, and slight discoloration. On the right side of the page, there is a vertical column of text, which appears to be a list or a series of short entries. The script is fluid and consistent throughout the page. The left edge of the page shows the binding of the book, with the thickness of the pages visible. The overall impression is that of a historical document or a personal record.

bore along the record of his practice in the florid guttaceous
of his face... in one of these patients, a symptom existed which
as far, as I have been able to learn is not generally atten-
dant on this disease; a wasting and obstinate diarrhoea
this evidently arose from the same cause which produced
the increased discharge of urine. a return of the diarrhoea
was invariably preceded by an increased flow of urine and
in proportion as the urinary discharge was augmented
the disease of the bowels became aggravated. in this case
so certainly did a variety of circumstances point to a dis-
eased liver, that had I not been too much tied down by
a particular theory, and fearing it might militate against
the hitherto only known method of alleviation I should, un-
questionably have attempted the removal of this disease
by the use of mercury, together with the accompanying
remedies used for the cure of chronic hepatitis.

Finis.
